## ***Maldives Link Project***

***By***

***Mr. Suraj Mhatugade***

***Tech TANGENT Solutions Pvt Ltd***

# Content

- Introduction to Project
- Loadings as per Eurocode
- Design of Monopile

# OVERVIEW OF THE PROJECT

- **Project Name: Greater Male Connectivity- Male to Thilafushi Link Project**
- **Project Length: 6.73 km**
- **Construction Cost: 4400 cr**
- **Completion Period: 32 months**
- **Owner: Ministry of National Planning, Housing and Infrastructure, Government of Maldives**
- **Contractor: AFCONS Infrastructure Ltd**
- **Design Consultant: AECOM and Tech Tangent Solutions Pvt. Ltd.**
- **Independent Engineer : SYSTRA**

conditions for normal  
traffic)**

# BRAKING LOADS

## 1. Braking Load for LM 1

i) for LM 1

Braking load is given by

Eq. 4.6, EN 1991-2:2003

$$Q_{ik} = 0,6\alpha_{Q1}(2Q_{ik}) + 0,10\alpha_{q1}q_{ik}w_1L$$
$$180\alpha_{Q1} (kN) \leq Q_{ik} \leq 900 (kN) \quad (4.6)$$

- $\alpha$  = Adjustment factor  
Q = Axle Load  
q = UDL  
w = Total width of CW  
L = Width of a Lane

BACKGROUND TO UK NATIONAL ANNEXES TO  
EN 1990 AnnexA2 and EN1991-2

Table 1: Comparison of  $\alpha$ -factors

EN1991-2		NAD		National Annex	
TS kN	UDL kN/m <sup>2</sup>	TS kN	UDL kN/m <sup>2</sup>	TS kN	UDL kN/m <sup>2</sup>
1.0	1.0	0.844	0.40	1.0	0.6111

# BRAKING LOADS

## 2. Braking Load for SPV

ii) for LM 3 (SV196)

Clause NA.2.18.1, NA to BS EN 1991-2:2003

Braking Load,  $Q_{lk,S}$  =  $\bar{\delta}w$  (where  $\bar{\delta} = 0.25$  for SV196)

Sl no	Axle load, $w$ (kN)	$\bar{\delta}w$ (kN)
1	165	41.3
2	165	41.3
3	165	41.3
4	165	41.3
5	165	41.3
6	165	41.3
7	165	41.3
8	165	41.3
9	165	41.3
10	180	45.0
11	180	45.0
12	100	25.0
Total		486
UDL for total length of bridge		7.07 kN/m

### Longitudinal braking and acceleration forces

The longitudinal force should be taken as the more severe of either the braking or the acceleration force, determined as below.

The characteristic value of longitudinal braking force on individual axles,  $Q_{lk,S}$ , expressed in kN, of special vehicles (both SV and SOV) should be calculated as follows:

$$Q_{lk,S} = \bar{\delta}w$$

Where  $\bar{\delta}$  is the deceleration factor and  $w$  is the basic axle load of the relevant SV or SOV vehicle in kN shown in Figures NA.1, NA.2 and NA.3. The value of  $\bar{\delta}$  should be taken as 0,5 for SV80, 0,40 for SV100, 0,25 for the SV196 and 0,20 for all of the SOV model vehicles.

# Live Load Surcharge

Two horizontal line loads each of  $F$  kN applied at ground level over a width of 1 m, adjacent to the edge of the lane as shown

Table 7 Horizontal surcharge model for highway traffic loading

	Loading from normal traffic		SV/100 and SV/196 <sup>A)</sup>	
	Horizontal line load $F$ at top of structure <sup>B)</sup>	Horizontal uniformly distributed load (UDL) $\sigma_h$	Horizontal line load $F$ at top of structure <sup>B)</sup>	Horizontal UDL $\sigma_h$
Case A: Characteristic horizontal surcharge for each effective lane of traffic <sup>C), D)</sup>	Two 1 m wide line loads each $330K_d L_f$ (kN)	3 m wide UDL of $20K_d R L_f$ ( $\text{kN/m}^2$ )	Two 1 m wide line loads each $330K_d$ (kN)	3 m wide UDL of $30K_d$ ( $\text{kN/m}^2$ )
Case B: Characteristic horizontal surcharge for a metre width design <sup>B)</sup>	$330K_d D_f$ (kN/m) width	$20K_d R$ ( $\text{kN/m}^2$ )	$330K_d D_f$ (kN/m) width	$30K_d$ ( $\text{kN/m}^2$ )
Case C: Characteristic horizontal surcharge for segmental structures <sup>F)</sup>	$330K_d$ (kN/m) width	$20K_d R$ ( $\text{kN/m}^2$ )	$330K_d$ (kN/m) width	$30K_d$ ( $\text{kN/m}^2$ )

where:

$K_d$  is the design value of  $K_a$  or  $K_o$  (as appropriate) based on  $\Phi'_d$

$R$  is  $3.0/W_{eff}$ ;

$L_f$  is the lane factor specified in the UK National Annex to BS EN 1991-2:2003, NA.2.34.2; and

D	1,35	0,20	0,8	2,0
E	1,4	0,15	0,5	2,0

$S_c(T)$  is the elastic response spectrum;

$T_B$  is the lower limit of the period of the constant spectral acceleration branch;

$T_C$  is the upper limit of the period of the constant spectral acceleration branch;

$T_D$  is the value defining the beginning of the constant displacement response range of the spectrum;

Fig. 5.1 (b) Spectra for Elastic Response Spectrum Method

# Seismic Load

## 3.2.2.2 Horizontal elastic response spectrum

(1)P For the horizontal components of the seismic action, the elastic response spectrum  $S_e(T)$  is defined by the following expressions (see Figure. 3.1):

$$0 \leq T \leq T_B : S_e(T) = a_g \cdot S \cdot \left[ 1 + \frac{T}{T_B} \cdot (\eta \cdot 2,5 - 1) \right] \quad (3.2)$$

$$T_B \leq T \leq T_C : S_e(T) = a_g \cdot S \cdot \eta \cdot 2,5 \quad (3.3)$$

$$T_C \leq T \leq T_D : S_e(T) = a_g \cdot S \cdot \eta \cdot 2,5 \left[ \frac{T_C}{T} \right] \quad (3.4)$$

$$T_D \leq T \leq 4s : S_e(T) = a_g \cdot S \cdot \eta \cdot 2,5 \left[ \frac{T_C T_D}{T^2} \right] \quad (3.5)$$

where

$S_e(T)$  is the elastic response spectrum;

$T$  is the vibration period of a linear single-degree-of-freedom system;

$a_g$  is the design ground acceleration on type A ground ( $a_g = \gamma \cdot a_{gR}$ );

$T_B$  is the lower limit of the period of the constant spectral acceleration branch;

$T_C$  is the upper limit of the period of the constant spectral acceleration branch;

$T_D$  is the value defining the beginning of the constant displacement response range of the spectrum;

$S$  is the soil factor;

$\eta$  is the damping correction factor with a reference value of  $\eta = 1$  for 5% viscous damping, see (3) of this subclause.

# Wind Load

Basic Velocity Pressure

$$q_b = 1/2 \cdot \rho \cdot V_b^2$$

Basic Wind Velocity,

$$V_b = C_{dir} \cdot C_{season} \cdot V_{b0}$$

irrespective of wind direction and time of year (i.e.  $C_{dir}$  and  $C_{season}$  are both 1.0)

- Basic Wind Speed - **27.7 m/s**
- Height of the Deck from MSL - **8m**
- Drag coefficient – 1.3 (Fig. 8.3 EN 1991-1-4:2005)
- Exposure coefficient – 2.9 (Fig. NA.7, BS-EN 1991-1-4:2005)

# Ship Impact

All the marine piers where water depth is more than 2m during MHHW, shall be designed for the **ship** impact design force shown in table below. The design vessel is based on the passenger ferries of 250 DWT, 35m LOA, 2m draft and 3.5m bow depth. The yearly mean current speed is assumed to be 3.5 m/s.

Distance of pier from centreline of each navigation channel [m]	Impact Force (including dynamic amplification factor of 1.3) [kN]
50	13800
60	12900
70	11900
80	11000
90	10000
100	9100
105	8600
<b>&gt;105</b>	<b>8600 (passenger ferries)</b>

# Ship Impact

Figure 7: Case a) Loaded Barge Impact - Water at MHHW + 1m sea level rise

# Tsunami Load

Tsunami force is calculated according to ASCE 7-16.

$$\text{Tsunami Force} = F_w = 0.5 \rho_s I_{tsu} C_d b (h_e u^2)$$

$$\text{Tsunami pressure at certain depth} = 0.5 \rho_s I_{tsu} C_d b (u^2)$$

$$\rho_s = 1.0 \rho_{sw} = 1025 \text{ kg/m}^3$$

$$I_{tsu} = 1.0 \quad \text{Cl. 10.8.4 of Appendix B of Employers requirements}$$

$$C_d = 1.2 \quad \text{Table 6.10-2-ASCE 7-16}$$

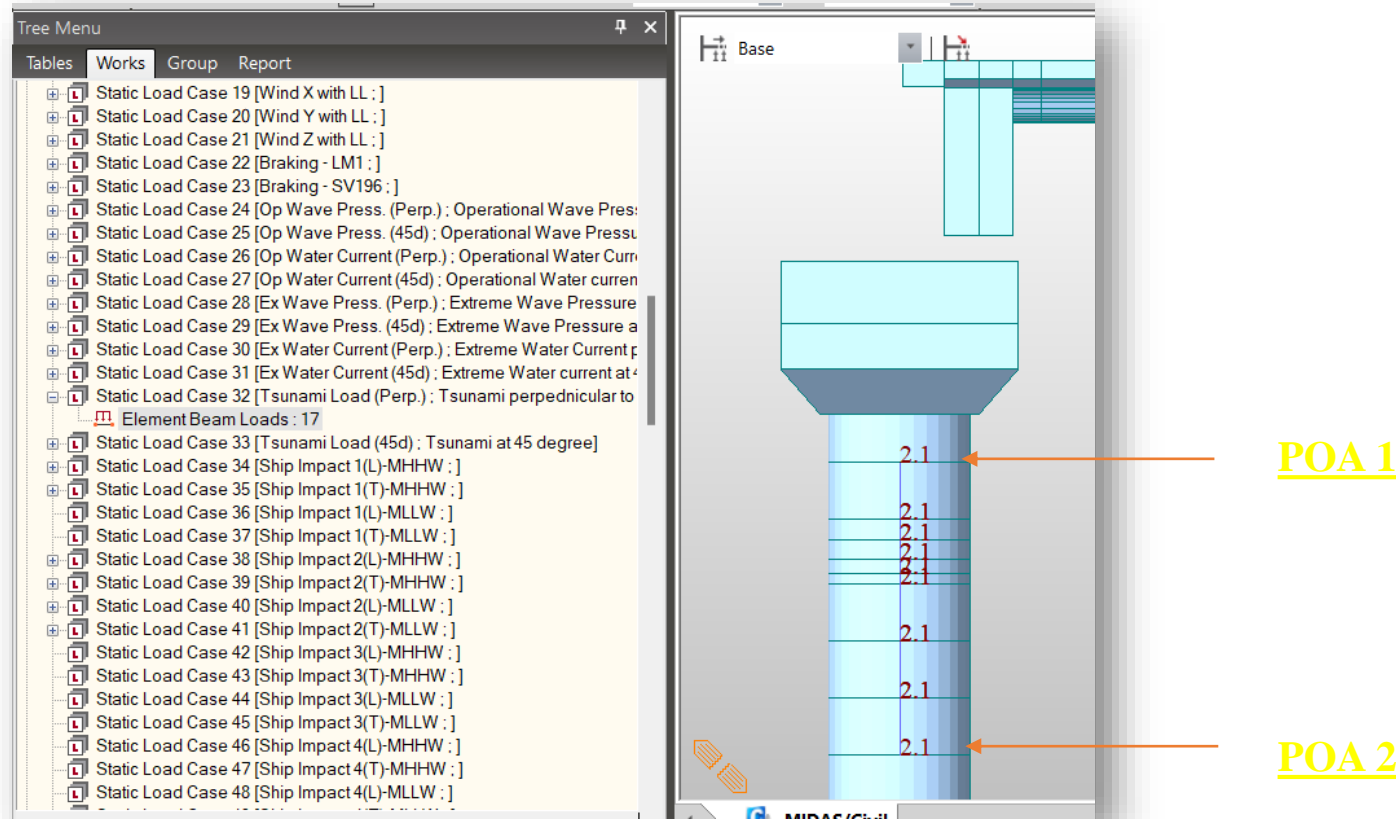

$$u = \text{Flow velocity}$$

# Tsunami Load- Point of Application

## Point of application -

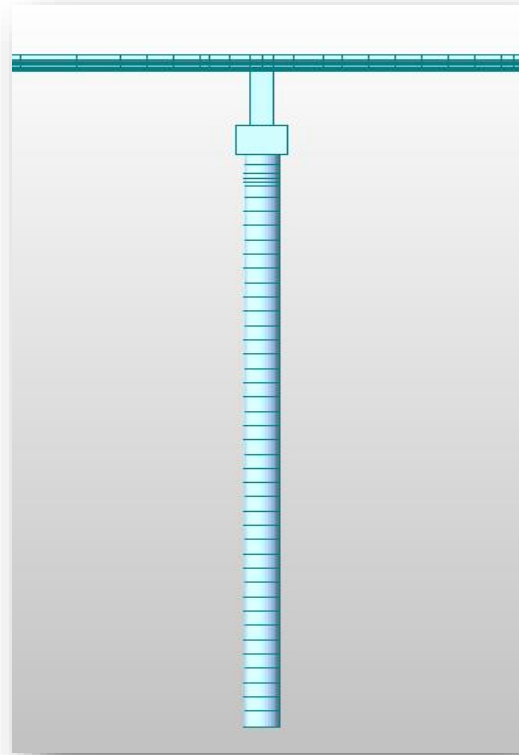

POA 1 -	Tsunami water level= Tidal water level + Sea level rise + Tsunami amplitude
POA 2 -	Scour level

# *Soil Structure Interaction*

# Need of Soil Structure Interaction / P-Y curves

- Structure becomes more Rigid
- Time Period Decreases
- Seismic Forces Increases

- Structure becomes more Flexible
- Time Period Increases
- Seismic Forces Decreases

# P-Y Curves (Load – Deformation curve)

P-Y curve for Massive Rock

# P-Y Curves

P-Y curve for Soft Clay

# P-Y Curves

P-Y curve for Liquefied Sands

# Monopile Foundation

- A [foundation](#) consisting of a single, generally large-diameter, [structural element](#) that supports the entire [load](#) of a large above-surface structure.

# Advantages - Monopile Foundation

- Less space is required for construction
- Reduction in Number of Piles
- Less Construction Time
- No Differential settlement
- More Clearance for Navigational Spans
- In Mumbai Coastal road project number of piles has come down to 176 from 704 due to the introduction of Monopile system

# Monopile Foundation

## 5.8.3 Simplified criteria for second order effects

### 5.8.3.1 Slenderness criterion for isolated members

(1) As an alternative to 5.8.2 (6), second order effects may be ignored if the slenderness  $\lambda$  (as defined in 5.8.3.2) is below a certain value  $\lambda_{lim}$ .

**Note:** The value of  $\lambda_{lim}$  for use in a Country may be found in its National Annex. The recommended value follows from:

$$\lambda_{lim} = 20 \cdot A \cdot B \cdot C / \sqrt{n} \quad (5.13N)$$

where:

$$A = 1 / (1 + 0,2\varphi_{ef}) \quad (\text{if } \varphi_{ef} \text{ is not known, } A = 0,7 \text{ may be used})$$

$$B = \sqrt{1 + 2\omega} \quad (\text{if } \omega \text{ is not known, } B = 1,1 \text{ may be used})$$

$$C = 1,7 - r_m \quad (\text{if } r_m \text{ is not known, } C = 0,7 \text{ may be used})$$

$\varphi_{ef}$  effective creep ratio; see 5.8.4;

$\omega = A_s f_{yd} / (A_c f_{cd})$ ; mechanical reinforcement ratio;

$A_s$  is the total area of longitudinal reinforcement

$n = N_{Ed} / (A_c f_{cd})$ ; relative normal force

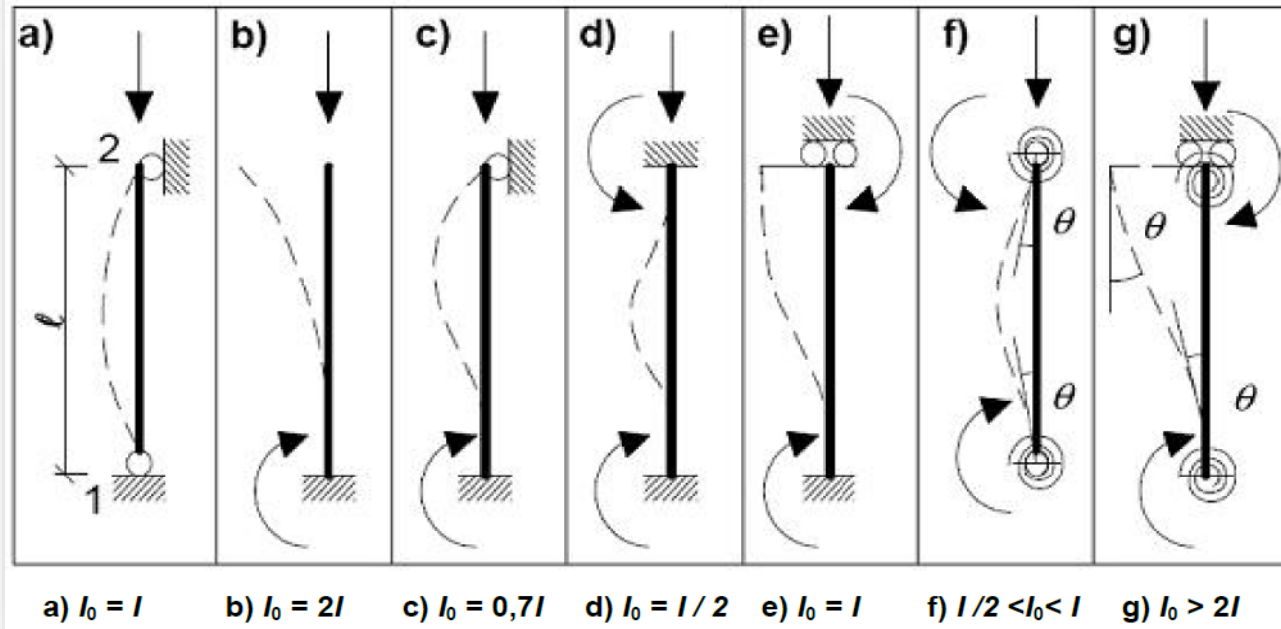

$r_m = M_{01} / M_{02}$ ; moment ratio

$M_{01}, M_{02}$  are the first order end moments,  $|M_{02}| \geq |M_{01}|$

# Design of Monopile

BS EN 1992-1-1:2004  
EN 1992-1-1:2004 (E)

Effective Length = Length of Pier from soffit level to pilehead top + pile head depth  
+ Length of pile till depth of fixity

# Design of Monopile

BS EN 1992-1-1:2004  
EN 1992-1-1:2004 (E)

## 5.8.5 Methods of analysis

(1) The methods of analysis include a general method, based on non-linear second order analysis, see 5.8.6 and the following two simplified methods:

- (a) Method based on nominal stiffness, see 5.8.7
- (b) Method based on nominal curvature, see 5.8.8

**Note 1:** The selection of Simplified Method (a) and (b) to be used in a Country may be found in its National Annex.

**Note 2:** Nominal second order moments provided by the simplified methods (a) and (b) are sometimes greater than those corresponding to instability. This is to ensure that the total moment is compatible with the cross section resistance.

(2) Method (a) may be used for both isolated members and whole structures, if nominal stiffness values are estimated appropriately; see 5.8.7.

(3) Method (b) is mainly suitable for isolated members; see 5.8.8. However, with realistic assumptions concerning the distribution of curvature, the method in 5.8.8 can also be used for structures.

EN 1992-1-1:2004 (E)

## 5.8.7.3 Moment magnification factor

(1) The total design moment, including second order moment, may be expressed as a  $\alpha_{AC1}$  magnification of the bending moments resulting from a first order analysis, namely:  $\alpha_{AC1}$

$$M_{Ed} = M_{0Ed} \left[ 1 + \frac{\beta}{(N_B / N_{Ed}) - 1} \right] \quad (5.28)$$

where:

$M_{0Ed}$  is the first order moment; see also 5.8.8.2 (2)

$\beta$  is a factor which depends on distribution of 1<sup>st</sup> and 2<sup>nd</sup> order moments, see 5.8.7.3 (2)-(3)

$N_{Ed}$  is the design value of axial load

$N_B$  is the buckling load based on nominal stiffness  $= \frac{\pi^2 EI}{L^2}$

## 5.8.7.2 Nominal stiffness

(1) The following model may be used to estimate the nominal stiffness of slender compression members with arbitrary cross section:

$$EI = K_c E_{cd} I_c + K_s E_s I_s \quad (5.21)$$

where:

$E_{cd}$  is the design value of the modulus of elasticity of concrete, see 5.8.6 (3)

$I_c$  is the moment of inertia of concrete cross section

$E_s$  is the design value of the modulus of elasticity of reinforcement, 5.8.6 (3)

$I_s$  is the second moment of area of reinforcement, about the centre of area of the concrete

$K_c$  is a factor for effects of cracking, creep etc, see 5.8.7.2 (2) or (3)

$K_s$  is a factor for contribution of reinforcement, see 5.8.7.2 (2) or (3)

***THANK YOU***
